

AGRIPPA

PROJECT PAPER - VERSION 1.0

An independent community token on Base inspired by the emerging Muse / Agrippa internet narrative.

Network	Base mainnet - chain ID 8453
Contract	0xf7D67781f4E4385111235BaF1bCEf7330b04aa4C
Supply	100,000,000,000 AGRIPPA
Website	https://agrippa.club
Contact	hello@agrippa.club

This paper records verified launch facts and current administrative controls. It does not promise utility, returns, continued development or exchange listing.

1. Identity and scope

AGRIPPA is a lightweight narrative experiment on Base. It is not a company, protocol governance token, security audit, claim on a business, or guarantee of future work. Other tokens use the AGRIPPA name. The full Base contract address is the canonical identifier for this project.

Non-affiliation

AGRIPPA is not affiliated with, endorsed by, sponsored by, or officially connected to Meta, Mark Zuckerberg, Muse or Robinhood.

2. Technical profile

Field	Verified value
Token / symbol	AGRIPPA / AGRIPPA
Network	Base mainnet - chain ID 8453
Contract	0xf7D67781f4E4385111235BaF1bCEf7330b04aa4C
Decimals	18
Architecture	Native Clanker V4/V4.1
Trading pair	AGRIPPA / WETH
Token image	ipfs://QmRVRhYm3rATuVhHZVYPzJEaeGEyQBxGsDi82369YLjEjy

AGRIPPA has no general creator mint function. A fixed Superchain bridge retains mint and burn authority for supported cross-chain operations. Bridge authority must not be confused with a creator-controlled inflation mechanism.

Launch verification

The deployment package was rehearsed on a Base fork and checked after launch for supply, allocations, roles, schedules, fees, pool and image metadata. Source code is published on BaseScan. These checks are project testing, not an independent security audit.

3. Supply and allocation

AGRIPPA launched with an initial supply of 100,000,000,000 tokens. The verified initial allocation is shown below.

Allocation	Share	Amount	Initial mechanism
Market / liquidity	90%	90B	Native Clanker liquidity
Creator vault	8%	8B	30-day lock, then 180-day linear vest
Community reserve	2%	2B	Clanker Airdrop V2

The launch used the Balanced starting curve and a 0 ETH creator dev buy. Network gas was paid separately.

Creator vault

The 8B creator allocation is locked for 30 days after deployment, then vests linearly for 180 days. It becomes fully vested on day 210. The beneficiary is 0x9F31e2633c4f446532432B1FfF0744F95ffA4d97.

Vault contract	0x8E845EAd15737bF71904A30BdDD3aEE76d6ADF6C
Vesting begins	20 October 2026 at 03:54:07 UTC
Fully vested	18 April 2027 at 03:54:07 UTC

Community reserve

The 2B community allocation remains in a separate Clanker Airdrop V2 contract. The reserve launched with administrator 0xb5A5E644a20d3a382BeE2651C88a64f923f8F990 and an empty root. Administration was later transferred to the creator / token-admin wallet 0x9F31e2633c4f446532432B1FfF0744F95ffA4d97 to configure Community Drop 01. The reserve remains contractually separate, but its current administrator is not a separate wallet.

4. Community Drop 01

Community Drop 01 uses a confirmed Merkle root covering 200 recipient wallets. Claims require a matching proof and do not open until the fixed day-30 unlock. The allocation and eligibility data are off-chain inputs committed by the root.

Airdrop V2 contract	0xf652B3610D75D81871bf96DB50825d9af28391E0
Current reserve admin	0x9F31e2633c4f446532432B1FfF0744F95ffA4d97
Merkle root	0x00165328a4ba90aaba299b4f88891841d69c75d7c3463f30254878f4bec439db
Claims open	20 October 2026 at 03:54:07 UTC
Recovery available	3 November 2026 at 03:54:07 UTC
Root transaction	0x258fcee45cc321584d4e5aa010898ab1695dbca2558887485f7a5a573ff828d1

The current community admin can replace the Merkle root, transfer the admin role and, from day 44, recover tokens still held by the reserve to a chosen address. Recovery does not reach tokens already claimed and ends further claims. Replacing the root does not restart the fixed clock or guarantee a new claim period.

5. Fees and creator rewards

The normal LP fee is 1% on buys and sells. Clanker charges a separate protocol fee equal to 20% of the LP fee rate, or 0.20% when the LP fee is 1%. The normal combined fee is therefore approximately 1.20%, although routing, swap mechanics and interface fees can affect the exact cost.

The creator receives 100% of the rewardable LP share after the protocol fee, with a Paired/WETH preference. This is not 100% of trade proceeds, and token holders have no right to creator rewards. WETH conversion depends on actual trading and available conversion.

Standard Clanker anti-sniper settings temporarily applied much higher launch-protection fees that decayed under auction rules. These settings were launch protection, not the normal ongoing rate.

6. Administrative powers

Role	Current disclosed power
Token admin	May update token image or metadata and transfer the token-admin role.
Creator reward admin	May administer creator reward routing under the Clanker configuration.
Creator vault beneficiary	Receives vested creator tokens under the fixed vault schedule.
Community reserve admin	May replace the root, transfer administration and recover remaining unclaimed tokens from day 44.
Superchain bridge	Has mint and burn authority for supported cross-chain operations.

The token admin, creator reward roles, creator vault beneficiary and current community reserve admin are associated with 0x9F31e2633c4f446532432B1FfF0744F95ffA4d97. These powers are not described as renounced.

7. Risks

AGRIPPA is speculative. Price can be highly volatile, liquidity can be limited, and buyers can lose the full amount spent. No guaranteed value, income, return, roadmap, future utility, community distribution outcome or listing is promised. Smart contracts, bridges, wallets, interfaces, indexing services and liquidity pools can fail or display incomplete data.

The project has not published an AGRIPPA-specific independent audit. Published source code and project testing do not establish safety. Administrative keys can change metadata, reward routing and community distribution settings as described above.
